Assignment 03

①

Question 1:

$$\begin{aligned}\text{Total Instruction Time} &= \text{add} + \text{addi} + \text{not} + \text{beq} + \text{lw} + \text{sw} \\ &= 20\% + 20\% + 0\% + 25\% + 25\% + 10\% \\ &= 100\% \\ &= 1\end{aligned}$$

We know, only SW, LW use Data Memory.

$$\text{lw} + \text{sw} = (25\% + 10\%) = 35\%$$

$\therefore$  Data Memory is used = 35%

$$= \frac{35}{1} = .35 \text{ fraction}$$

of all cycles.

(Ans)

11

Question 2:

For addi: making 16 offset/integer value, we need to sign-extend circuit.

For beq: need sign-extenders to convert 16 bit offset to 32 bit.

For lw and sw: need sign-extenders to convert 16 bit offset to 32 bit.

∴ The input of the sign-extend circuit needed

$$= (30\% + 25\% + 25\% + 10\%)$$

$$= 80\%$$

$$= \frac{1}{8} \text{ fraction of all cycles.}$$

Question 3:

Using only stall to overcome the data hazard:

III

LW \$t0, 36(\$t2)

LW \$t2, 40(\$t0)

LW \$t3, 44(\$t2)

Sll \$t3, \$t2, 2

Sub \$t0, \$t3, \$t2

Addi \$t0, \$t0, 2

12

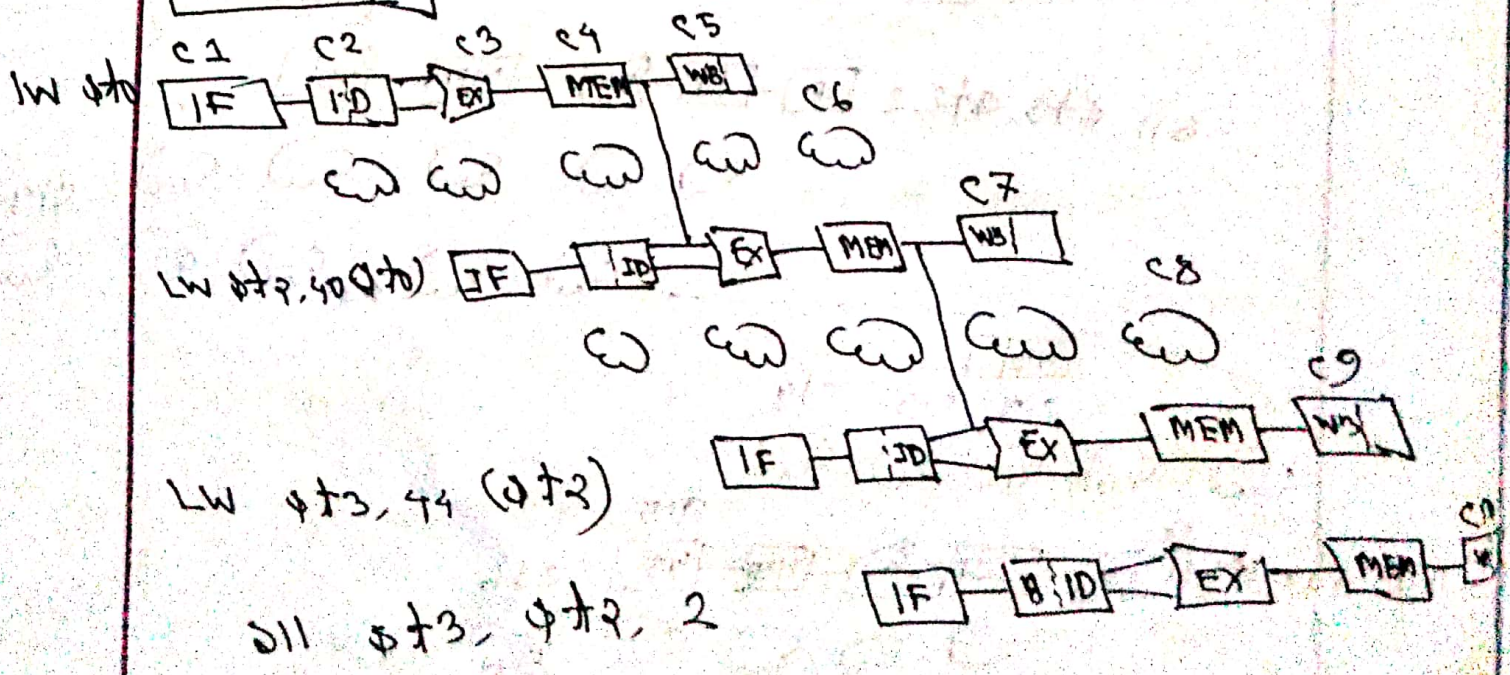

Writing again for better visualization

∴ 19 clock cycles needed for executing above code sequence.

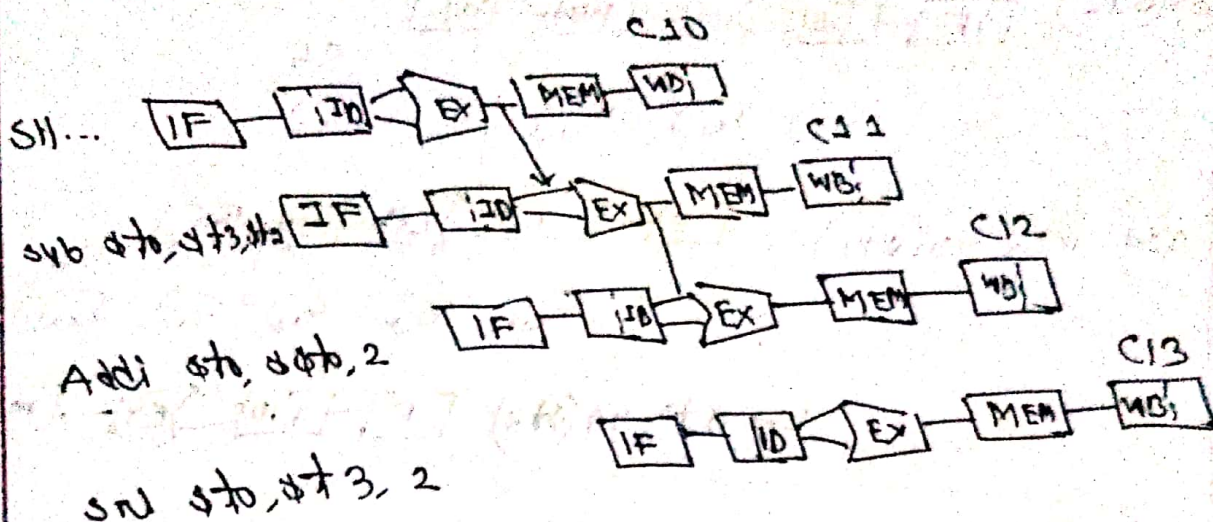

For CPI =  $\frac{\text{Total clock cycles}}{\text{Total Instructions}} = \frac{19}{7} = 2.714285714$  (Ans)

Question 4:

Page (V)

∴ 13 clock cycles needed for executing the code using

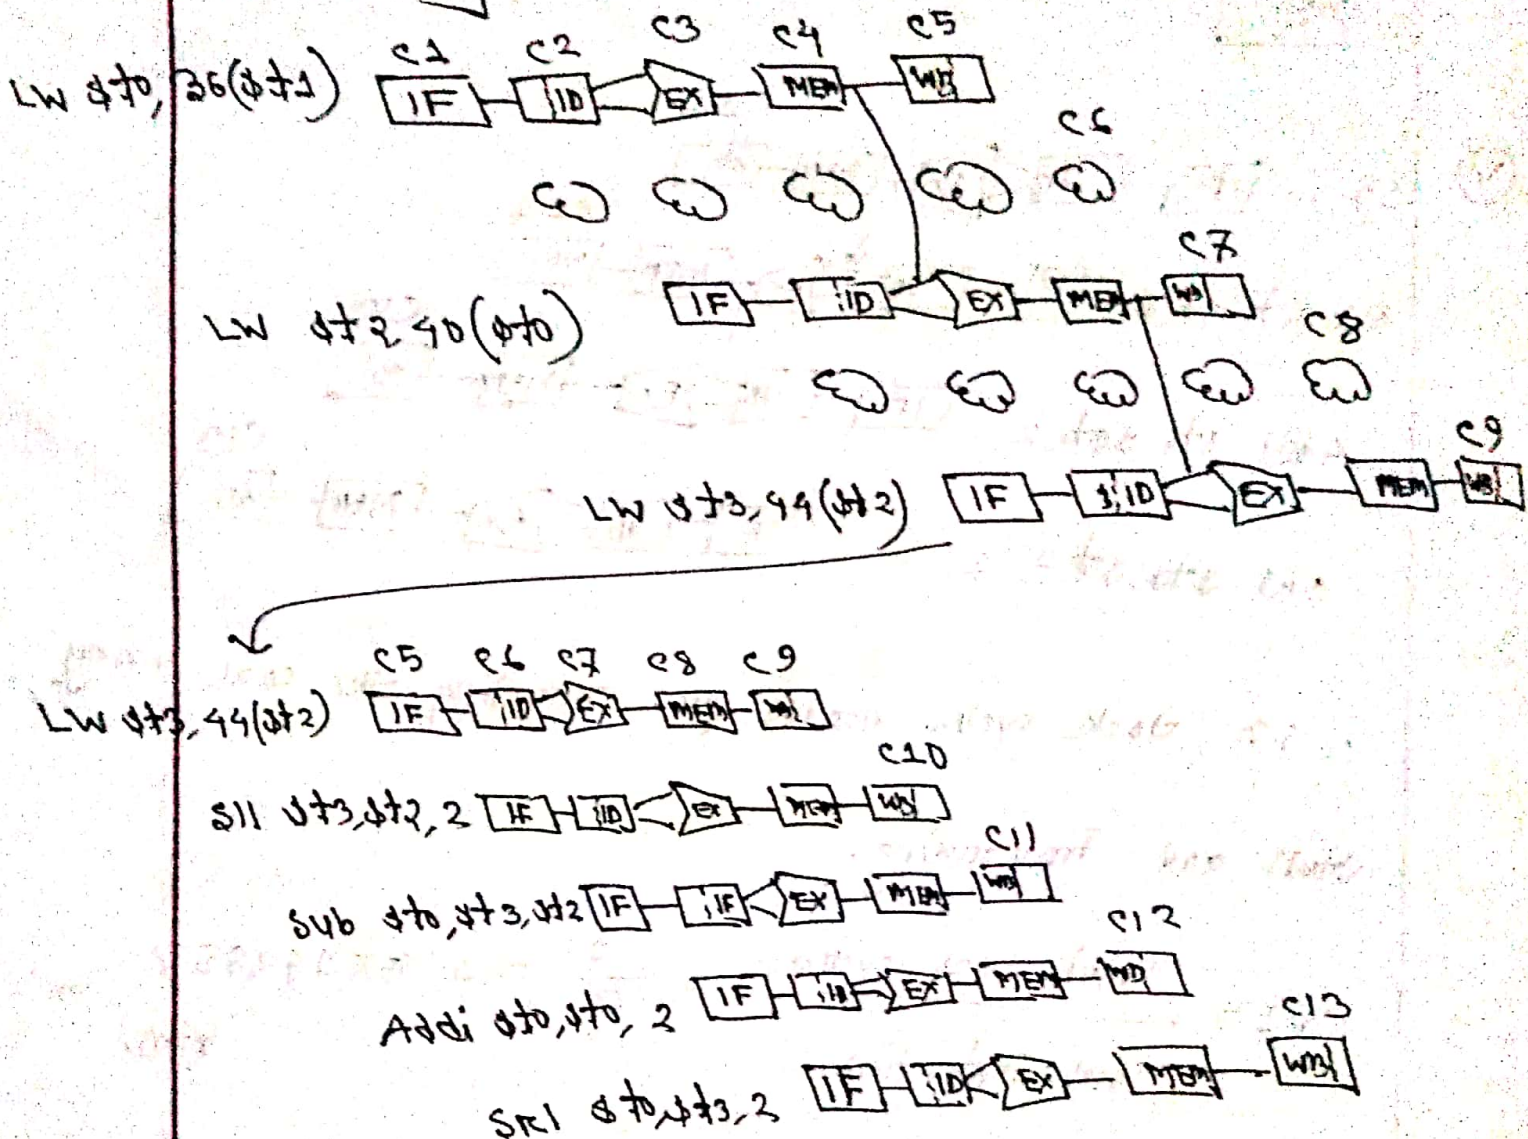

stall and forwarding.

$$CPI = \frac{\text{Total clock cycles}}{\text{Total Instructions}} = \frac{13}{7} = 1.857142857 \quad (\text{Ans})$$

VI

# Question 6:

Here, Addi just add 2 with \$t0 and store the value to \$t0 again and \$t0 gets updated in next line again. We could schedule Addi after second LW instruction as no instruction use \$t0 value again. But \$t0 we can not move an instruction out of its order

(vii)

if the instruction uses any updated value, here Addi  
uses s0 as source and it gets updated sub instruction.

So, ultimately we can not move Addi to anywhere.

So, the answer remain same as Question 4.

$\therefore$  13 clock cycles needed for executing the code

using stall, Forwarding and load ordering/ code scheduling.

$$CPI = \frac{\text{Total clock cycles}}{\text{Total instructions}} = \frac{13}{7} = 1.857142857 \quad (\text{Ans})$$

Answer no for

(Ans)
